A journey through the Tidyverse

Thomas Hütter, Diplom-Betriebswirt

- Application developer, project manager, consultant, speaker
- Worked at consultancies, ISVs, end user companies
- Speaker at SQL events around Europe
- SQL Server 6.5 - 2016, Nav 3.01 - 2017, R 3.1.2 - 3.4.0

Agenda

- Prerequisites: R base system, IDE, Tidyverse packages
- The Tidyverse concept: why and what?
- The Tidyverse components: packages and demos
- Wrap-up, ressources & credits, Q&A

Pre-Prerequisites

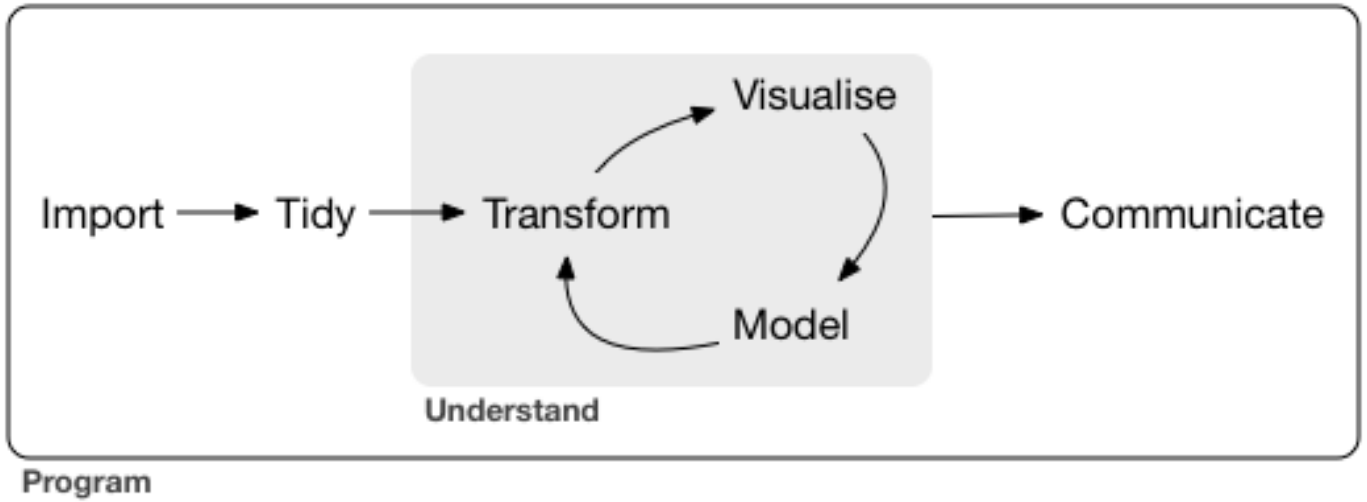
- Programming language for statistical computing and visualization, widely used by statisticians, data miners, analysts, data scientists
- Created by Ross Ihaka and Robert Gentleman, Uni Auckland, in 1993 as an open source implementation of the (1970s) S language
- GNU project, maintained by the R Foundation for Statistical Computing, compiled builds für Mac OS, Linux, Windows, supported by R Consortium
- Extensible through user-created packages, > 10.000 available on CRAN
- Commercial support, e.g. since 2007 by Revolution Analytics, acquired by Microsoft in 2015, now provide Microsoft R Open, R Server
- IDEs: R.App, RStudio 1.0.143, MS R Tools for VS (~~„nearly“~~ 1.0)
- Support for R now in SQL Server, Power BI, Azure ML

Prerequisites

- You already have an idea what R can be used for
- Install the R base system, available from https://cran.r-project.org/index.html
- Get the IDE of your choice, in my case RStudio: https://www.rstudio.com/products/rstudio/download/
- Of course we'll need the Tidyverse `install.packages(„tidyverse“)` then `library(tidyverse)` will load the core packages
- Let the fun begin!

The Tidyverse concept: why and what?

What a typical data analysis/data science project may look like



The components of the Tidyverse cover these tasks and can help you to accomplish them in a concise manner.

figure © 2017 Wickham/Grolemund: „R for Data Science"

The Tidyverse concept: why and what?

- „The goal of these principles is to provide a uniform interface so that Tidyverse packages work together naturally“. *)
- Tidy data is data stored it in a consistent, reusable structure, preferably in rectangular datasets, where ideally:
  1 row = 1 observation and 1 column = 1 variable.
- No need for conversions in the middle of analysis.
- You can concentrate on your data!

*) © 2017 Wickham: „The tidy tools manifesto“

The Tidyverse components

- Import: readr, DBI, haven, httr, jsonlite, readxl, rvest, XML2
- Tidy: tibble, tidyr
- Transform: dplyr, hms, lubridate, stringr, forcats
- Visualize: ggplot2
- Model: modelr, broom
- Communicate: *R Markdown*, ggplot2, *Shiny*
- Program: purrr, magrittr

Packages are: Core, additional, *non-Tidyverse*

Import

- readr: mainly imports flat files like csv and others
- DBI: database interface, encapsulating low-level driver work
- haven: import/export files from SPSS, Stata, SAS systems
- httr: handles http requests as GET() and POST()
- jsonlite: JSON anyone? Parse, generate, stream, …
- readxl: import Excel files into R (xls and xlsx)
- rvest: scrape („harvest“) web pages; wraps httr and XML2
- XML2: parse XML files

Transform

- dplyr: „A grammar of data manipulation“, provides functions according to the verbs of basic data manipulation: select, filter, arrange, mutate, summarize …
- hms: a „pretty“ time-of-day class
- lubridate: functions to work with date-times and time-spans
- stringr: simple, consistent wrapper for string operations
- forcats: tools for working with factors (reordering levels etc.)

Tidy

- tibble: „Tibbles are a modern take on data frames“
  - never change input types (strings <-> factors)
  - never adjust variable names (allow crazy names)
  - no row.names()
  - prettier print output
- tidyr: easily tidy data mainly with these functions:
  - gather() collapses multiple columns into key-value pairs
    converts wide -> long
  - spread() does the inverse of gather()
    converts long -> wide

Visualize

- ggplot2: create elegant data visualizations using the „grammar of graphics“
  - initialize a plot stating the data frame to be used
  - define the aesthetic mappings per plot or per layer
  - add layers of geometric representation of the data
  - add other options: scales, themes, facets

Model

- modelr: modelling functions that work with the pipe
- broom: convert statistical analysis output to a tidy format

Communicate

- *R Markdown*: package and tool to render markdown files to (X)HTML, pdf or other output formats
- ggplot2: see „Visualize“ section
- *Shiny*: a framework for easily building interactive web applications in R with minimal effort

Program

- magrittr: the forward pipe operator %>% for R, chaining of commands by forwarding the result of one function/expression into the next function call

- purrr: tools for functional programming, e.g.
  - using map_*() functions instead of loops or apply()
  - error handling: safely(), possibly(), quietly()

Tidyverse wrap-up

- „Tidy datasets are all alike, but every messy dataset is messy in it's own way" (Hadley Wickham)
- To avoid this, engage the tidy data philosophy and tools
- So preferably convert 'messy' to tidy data, where tidy means:
  - one variable per column
  - one observation per row
  - each type of observational unit is a tibble
- Easier passing of data between the tools / packages
- Make the tools work together in a natural way

A journey through the Tidyverse

Time for Q & A:

That is: questions that might be of common interest,
and their answers might fit into the remaining time :-)

Don‘t forget ... After-Show-Party!!!

5 Jahre SQL Saturday

an der Hochschule Bonn-Rhein-Sieg

SQLSat Bruzzler - Grillparty

Würstchen & Bier ab ca. **19.00 Uhr**

am Ende der Hochschulstraße
